(a) Double-Exponential Decay on Vertical Cauchy Walls
Wall magnitude $\log_{10}|G_y(L+i\eta)|$ $(y=0.40)$
Contour height $\eta = \mathrm{Im}(x) \in [0, \pi/4)$
Vertical wall $\xi = \pm 1.5$
Vertical wall $\xi = \pm 2.0$
Vertical wall $\xi = \pm 2.5$
Natural boundary $\eta = \pi/4$ $(\cos(2\eta) = 0)$
(b) Zero-Marginal Wigner Kernel vs. Hyperbolic Moment Lever
Normalized correlation and moment density
Mirror shift coordinate $y = u - v$
Unweighted kernel $I(y, \gamma_1)$ $(\int_0^\infty I(y, \gamma_1)\, dy = 0)$
Hyperbolic-weighted $y^2 \frac{\sinh(2dy)}{2dy} I(y, \gamma_1)$ $(d = 0.20)$
Positive coalesced tail $(y > y_0 \approx 0.2266)$
Suppressed inner trough $(y < y_0)$
